

GYANA SINHA

Software Developer

sinhagyanas31@gmail.com | 7903598175 | [Linkedin](#)

SUMMARY

Software Developer with around 2 years building production LLM and machine learning systems, Retrieval-Augmented Generation (RAG) pipelines, autonomous AI agents, and OCR-driven document intelligence platforms, on Python and Django. Strong foundation in scalable API design, asynchronous processing, database optimization, and AWS cloud architecture. Proven track record shipping AI features from prototype to production, including agentic task-planning systems, LLM based document extraction, and computer-vision identity verification.

TECHNICAL SKILLS

- **AI / ML Engineering:** RAG pipeline design, LLM integration (OpenAI APIs), LangChain, prompt engineering, agentic workflows & task planning, OCR-based extraction, embeddings & semantic search, computer-vision (face matching / ID verification)
- **Backend & Frontend:** Python, Django, Django REST Framework (DRF), FastAPI, REST API design, HTML, CSS, JavaScript, React
- **Data & Infra:** PostgreSQL, MySQL, MongoDB Celery, Redis, AWS (S3, Lambda, Bedrock)
- **Engineering Practices:** SDLC, system design, performance optimization, root cause analysis, code review, Git/GitHub, documentation, CI/CD pipelines

WORK EXPERIENCE

GMoney Pvt. Ltd. - Software Developer

Sept 2024 - Present

- Built AI powered document processing pipelines OCR, OpenAI APIs, LangChain, and Retrieval Augmented Generation (RAG) that automated structured-data extraction from medical and insurance documents, cutting manual review effort and accelerating claim turnaround.
- Designed and shipped a Video KYC identity-verification pipeline using AI based face extraction and Aadhaar image matching, replacing manual identity checks in the loan onboarding flow.
- Built a CIBIL evaluation module that automated loan eligibility assessment and credit limit calculation, reducing manual underwriting steps.
- Developed secure RESTful APIs for insurance claim management, policy validation, eligibility verification, and approval workflows, following full SDLC practices.
- Optimized PostgreSQL queries and API response times through indexing, query tuning, and caching, measurably improving application performance under load.
- Implemented asynchronous background processing Celery, Redis for claim validation, notifications, and workflow automation, improving system throughput and reliability.
- Investigated production issues end-to-end root cause analysis, defect fixes, and monitoring to maintain high application availability.
- Built a Sales Management System (lead management, onboarding, target allocation, approvals, reporting dashboards) and internal Task/Asset Management tools with SLA tracking and automated reminders.
- Integrated AWS S3 for secure document storage/retrieval and improved Django Admin usability via custom filters and query optimization.
- Collaborated cross functionally on requirements, code reviews, testing, documentation, and deployment.

Euspace Technologies - Intern Software Developer

Jan 2024 - June 2024

- Developed backend modules in Python/Django for multiple business applications and built REST APIs for frontend and third-party integration.
- Designed and maintained relational database structures in MySQL contributed to debugging, testing, and performance optimization.
- Collaborated with senior developers across the full SDLC and supported technical documentation and deployment.
- Collaborated with frontend team across HTML, CSS and React for UI development

PROJECTS

Autonomous AI Agent for Business Document Generation

- Built an autonomous AI agent python, FastAPI that interprets natural language business requests, generates its own execution plan (TODO list), and completes multi-step tasks with minimal human intervention an agentic AI workflow with planning, execution, and validation stages.
- Designed a modular architecture separating planning, execution, validation, and document-generation components for maintainability and scale.
- Auto-generated polished Word (.docx) documents from user requirements via python docx, and exposed the agent through REST APIs returning structured execution results.
- Engineered fallback and error-handling logic so the agent produces meaningful output even from ambiguous or incomplete requests.

AI-Powered Document Intelligence Platform

- Designed an end-to-end document processing platform Django, OpenAI APIs, Langchain, OCR, RAG for secure upload, validation, and structured data extraction.
- Built asynchronous processing pipelines Celery, Redis to handle high document volumes without blocking user-facing requests.
- Integrated AWS S3 for storage and added validation, exception handling, and logging to reduce response latency and improve reliability in production.

EDUCATION

- B.Tech in Information Technology - K.J. Somaiya College of Engineering, 2024 (80.00%)
- Diploma in Computer Technology - Sou. Venutai Chavan Polytechnic, 2021 (91.89%)
- SSC - B.D. Public School (86.06%)
